

# Ecology of the Cryosphere (MB162P30)

*Marek Stibal & international guest lecturers*

---

**The aim of this course is to introduce the cryosphere as an important and rapidly changing yet relatively unknown part of the Earth's system and a biome that contains distinct ecosystems and communities. Emphasis will be placed on recent and/or current research by the lecturers. This course will be principally focused on ecosystem-scale processes within the cryosphere and is complementary to the courses Winter Ecology and Polar Ecology. The course will be in English.**

1. **Introduction to the cryosphere** Cryosphere as part of the Earth's system • The icy biome • The past, present & future of the cryosphere
2. **The Snow Ecosystem** Snow formation • Energy and nutrient sources for snow • Snow algae as major primary producers in the cryosphere
3. **Glaciers and ice sheets** (guest lecture by Jacob Yde, Western Norway University of Applied Sciences) Formation of glacial ice • Glacier types • Glacier hydrology • History of glaciation • Glaciers as landscape architects
4. **Glacier ecology: The supraglacial ecosystem** Energy and nutrient sources for glacier surfaces • Cryoconite holes • Surface ice • Supraglacial lakes • Real world example: Ice algae and albedo feedback on the Greenland ice sheet
5. **Glacier ecology: The subglacial ecosystem** Energy and nutrient sources for glacier beds • Basal ice • Subglacial sediments • Subglacial lakes • Real world example: The bed of the Antarctic ice sheet as a methane reservoir
6. **Glacier ecology: The englacial ecosystem** Limitations for life within glacial ice • Ice cores as past climate proxies
7. **Glacier ecology: Glacial ecosystems in the warming world** Transition to proglacial ecosystems • Ecological succession of deglaciated land • Export of organisms and nutrients from glaciers to downstream ecosystems • Real world example: Export of microbial activity from beneath the Greenland ice sheet

8. **Sea ice** Formation of sea ice • Energy and nutrient sources for sea ice • Diatoms as major primary producers in the sea ice environment
9. **Permafrost ecology** Energy and nutrient sources for permafrost • Permafrost thawing and greenhouse gas release • Real world example: Seasonal change in the microbial community in the active layer of permafrost in Svalbard
10. **The future of the cryosphere** Global climate change and its impact on the cryosphere, or Are we losing the cryosphere for good?
